

JUAN JOSÉ VERÓN

Frontend Developer

ABOUT ME

I am an Information Systems Engineering student, a Self-taught learner and passionate about front-end development. In addition to my studies, I have also pursued my own learning through online courses, tutorials and personal projects. I have developed several projects, which have allowed me to put into practice the skills I have acquired. I am eagerly looking forward to participating in the creation of new and challenging projects with a great working group.

PROJECTS

+Cotas App

Web application, in which I worked as part of a 6-member team with the goal of finding and publishing lost pets in Resistencia and Corrientes.

Frontend:

- I configured the API services that we used.
- I developed the complete view of the posts with their respective functionalities.
- Managed the application states using Redux.
- Main routing and navigation permissions to private routes.
- I was responsible for deploying the frontend.

Backend:

- I set up the server from scratch in Express and connected it to the MongoDB database.
- Created the CRUD for users and posts following the MVC pattern.
- Image processing through Multer.
- Deployed each necessary endpoint to be used in our application through Railway.
- Password encryption and verification.

Page Rick and Morty

It is a personal project with the goal of creating a friendly and attractive user experience. I used technologies such as React, Redux, JavaScript, Styled Components, and Chakra UI. The page displays through an external API service the characters and episodes of the series. Users can save their favorite characters, remove them, filter characters by search, and view details for each character and episode. I tried to use clean architecture to make it easier to scale the project in the future and found challenges that I had not encountered before.

Movies API MDB

It is a web page of movies extracted through an API, in which you can search and view information about movies and save your favorite movies in local storage. This project was made with JavaScript Vanilla, CSS and HTML. I was inspired by the design of HBO max for the design and started to layout prioritizing the mobile view.

Food App

I developed a website for buying fruits and vegetables as a personal project. I aimed to make it closely resemble a mobile app, so I used a 'mobile first' development approach. The website features various product categories, a section for popular items, and is filtered through search. I used technologies such as React, JavaScript, CSS, Styled Components, and useContext to manage the application's state and implement the shopping cart feature. I created a file to mimic an API that provides all the data needed to extract product information.
